Satellite Data for TC Application

- It is a challenge to apply satellite Q/T data for TC application with traditional DA approaches
- Sat data irregular distributed and not representing the entire TC system and all variables

Can an OBS make consistent corrections to all variables with TC structure?

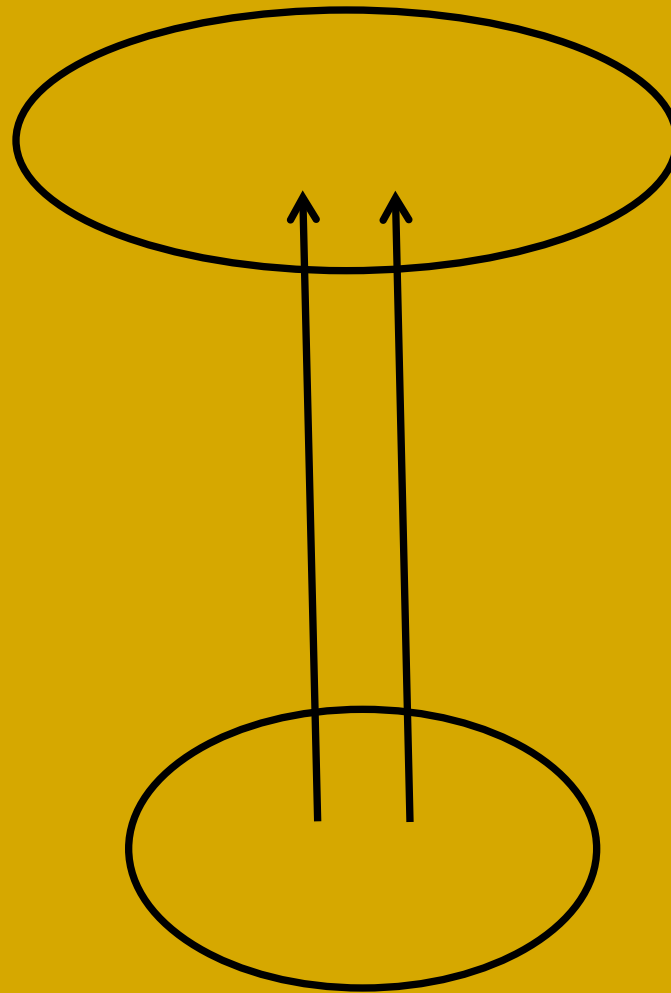

e.g., can a Q OBS correct wind?

- OBS

Features of Ensemble DA for TC Analysis

- Ensemble forecasts provide multivariate forecast error covariance estimates with TC structure
- Can generate analysis corrections according to TC structure as well as multivariate corrections
e.g., Water vapor impacts distant circulation

How EnKF makes winds adjustments by assimilating a Water Vapor OBS in a convective environment

Hurricane Ernesto case (2006)

Hurricane Ernesto (2006):

Formed as DS: 18Z 24 August

Reached Hurricane strength: 27 August

Dissipated: 1 September

12 UTC 23 and 24 August 2006

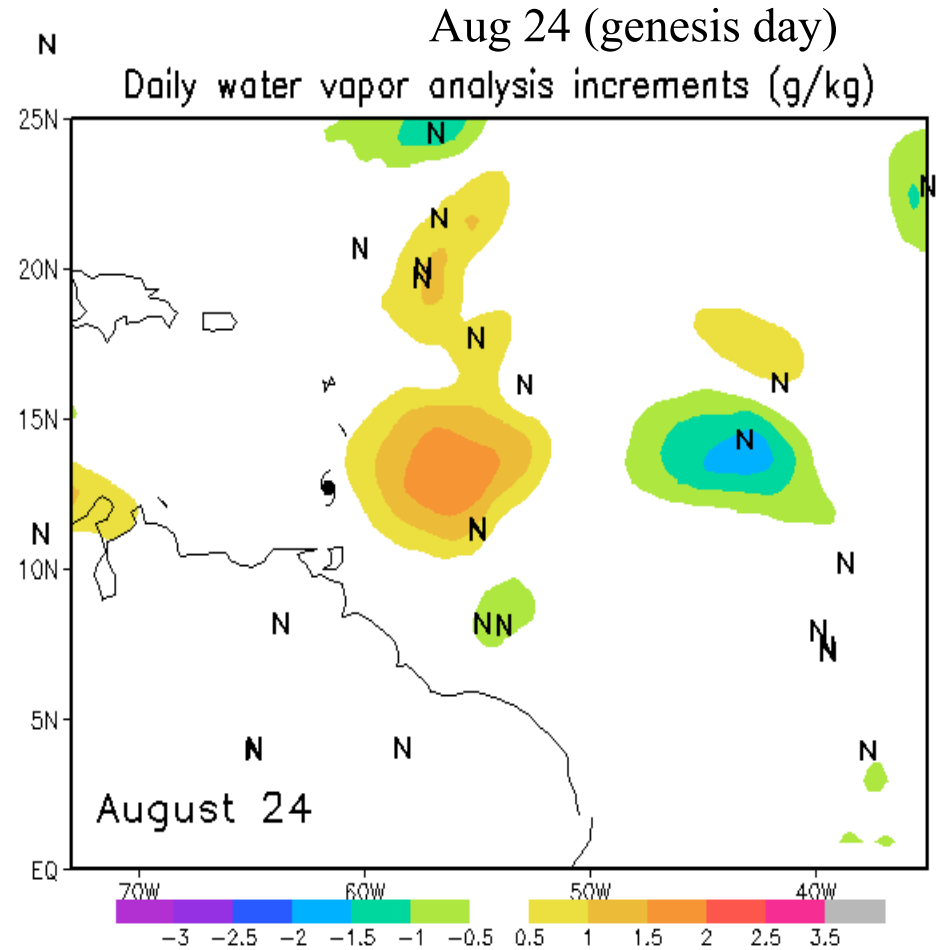

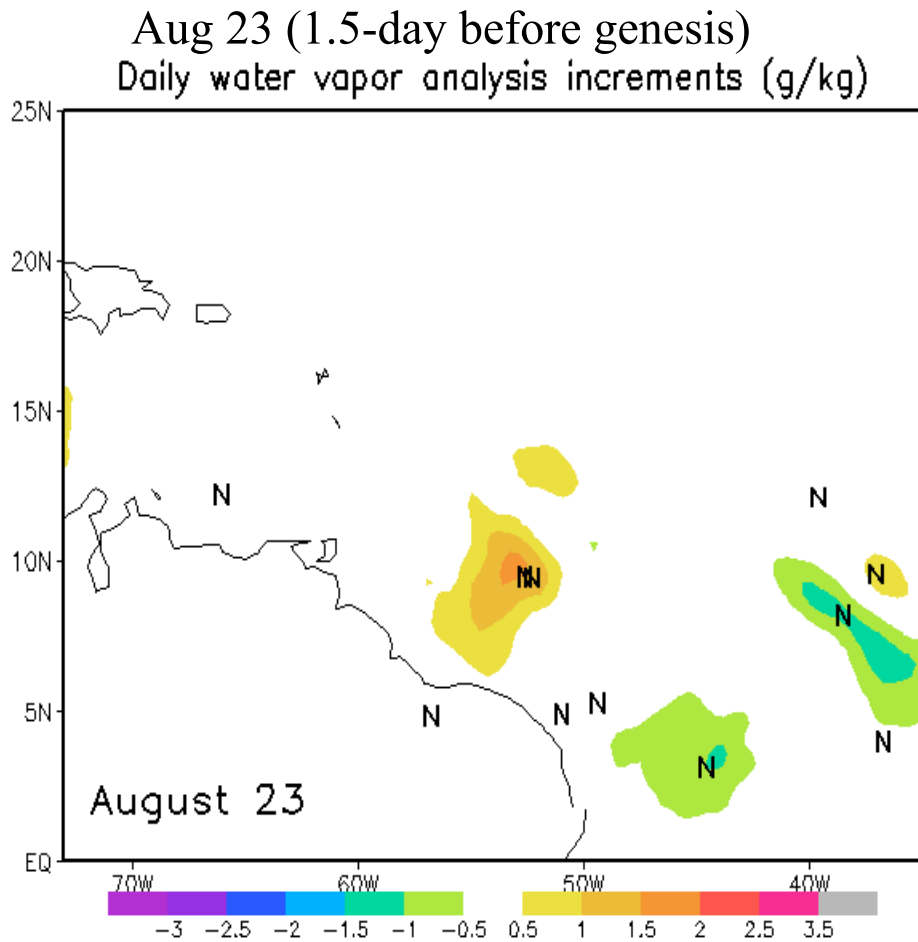

SAT IR image

GPS Data Assimilation Experiments (1)

- GPS refractivity has mainly WV info in lower troposphere
- **GPS-only run**: GPS refractivity only
- **NODA run**: assimilation of no data
- WRF/ARW v3.1; DART ensemble assimilation system
- 32 ensembles, 36km resolution
- Analysis 2-hourly, cycling 21-28 00UTC, August 2006

Daily Analysis Increments of water vapor (GPS-only run)

(700 hPa, 23-24, August 2006, g/kg)

GPS data increases water vapor in the genesis area

Daily Analysis Increments of Temperature (K), GPS-only run (700 hPa, 23, 24, August 2006)

Aug 23

Aug 24

T increments are small

Daily Analysis Increments of Wind (m/s, GPS-only run)

(23-24, August 2006)

Aug 23

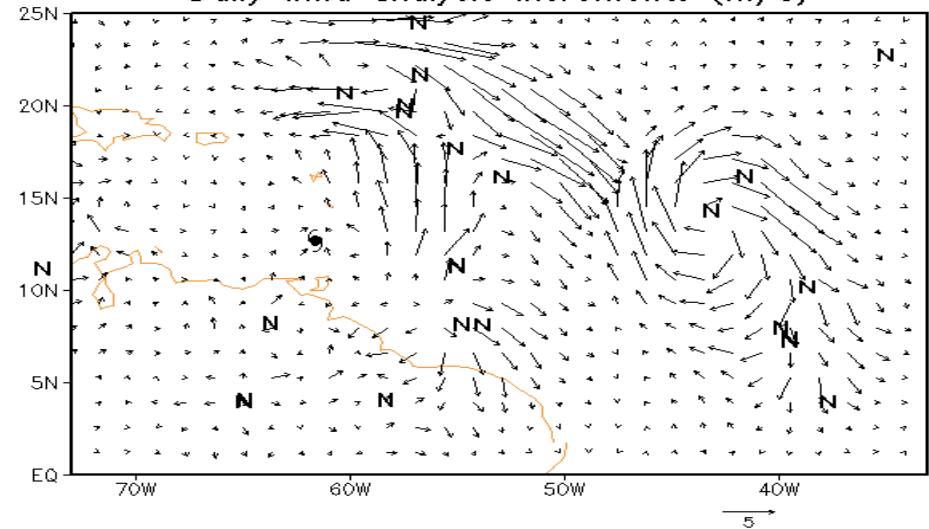

Daily wind analysis increments (m/s)

250 hPa_N

Aug 24

Daily wind analysis increments (m/s)

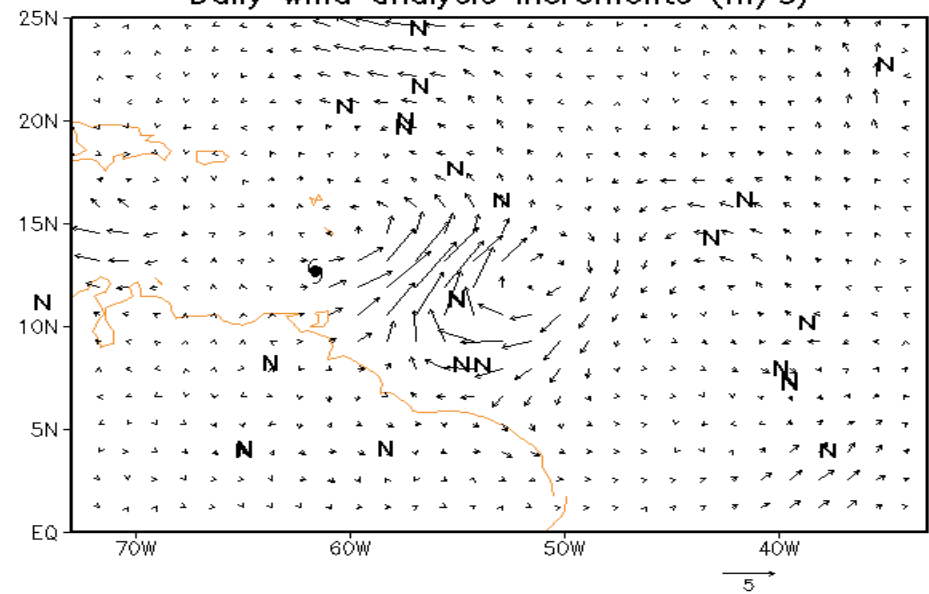

700 hPa_N

Daily wind analysis increments (m/s)

Daily wind analysis increments (m/s)

Daily Analysis Increments of Vertical Wind (cm/s, GPS-only run)

(23-24, August 2006)

Aug 23

500 hPa

Aug 24

GPS data induces upward motions

Fits of 2-hour Forecasts to Radiosondes (GPS_only, 21-28 00Z, August 2006)

Water vapor and wind RMS errors are reduced

RO Data Assimilation Experiments (2)

- **CTL run:** Radiosondes (UV,T,Q), cloud winds, aircraft data (UV,T), Ps
- **GPS run:** same as CTL run + GPS refractivity
- Examine analyses of TC tracks with and without GPS data

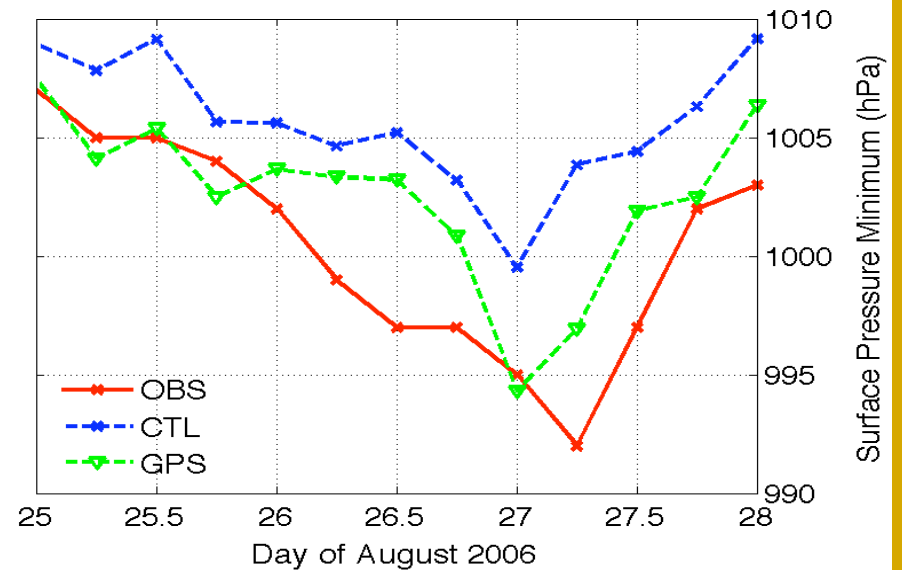

Analyses of 500 hPa height and SLP, UV

(initialized 00UTC 25, August 2006)

Track and MSLP errors are reduced

Analyses of Track and MSLP

(initialized 00UTC 25, August 2006)

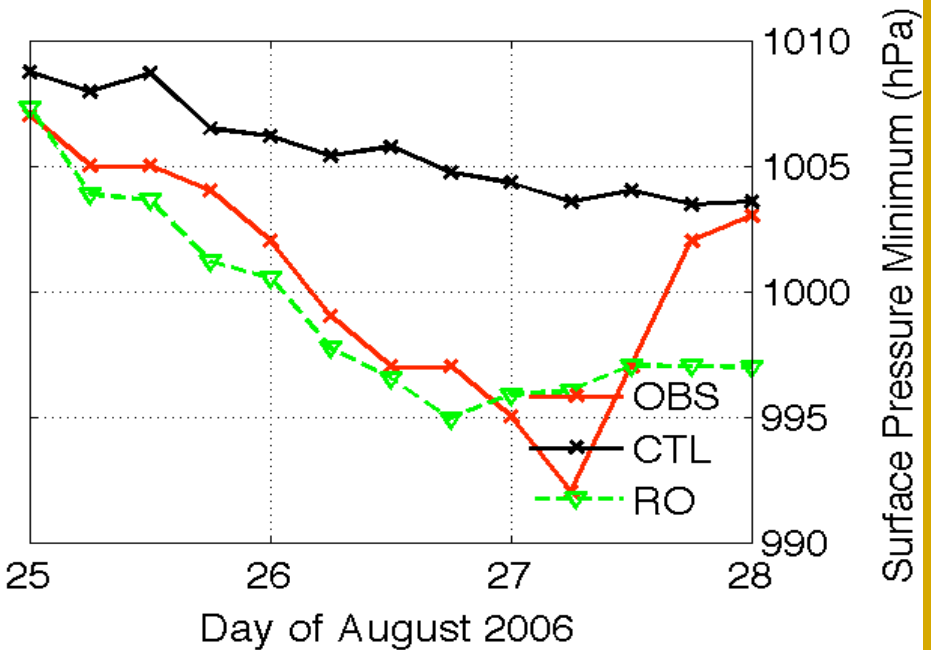

Track and MSLP errors are reduced

Track and MSLP 3-day Forecast

(after 4-days assimilation, from 00UTC 25, August 2006)

72-hour forecast (ensemble mean) from 00Z 25 August 2006

AIRS WV Assimilation Experiments (1)

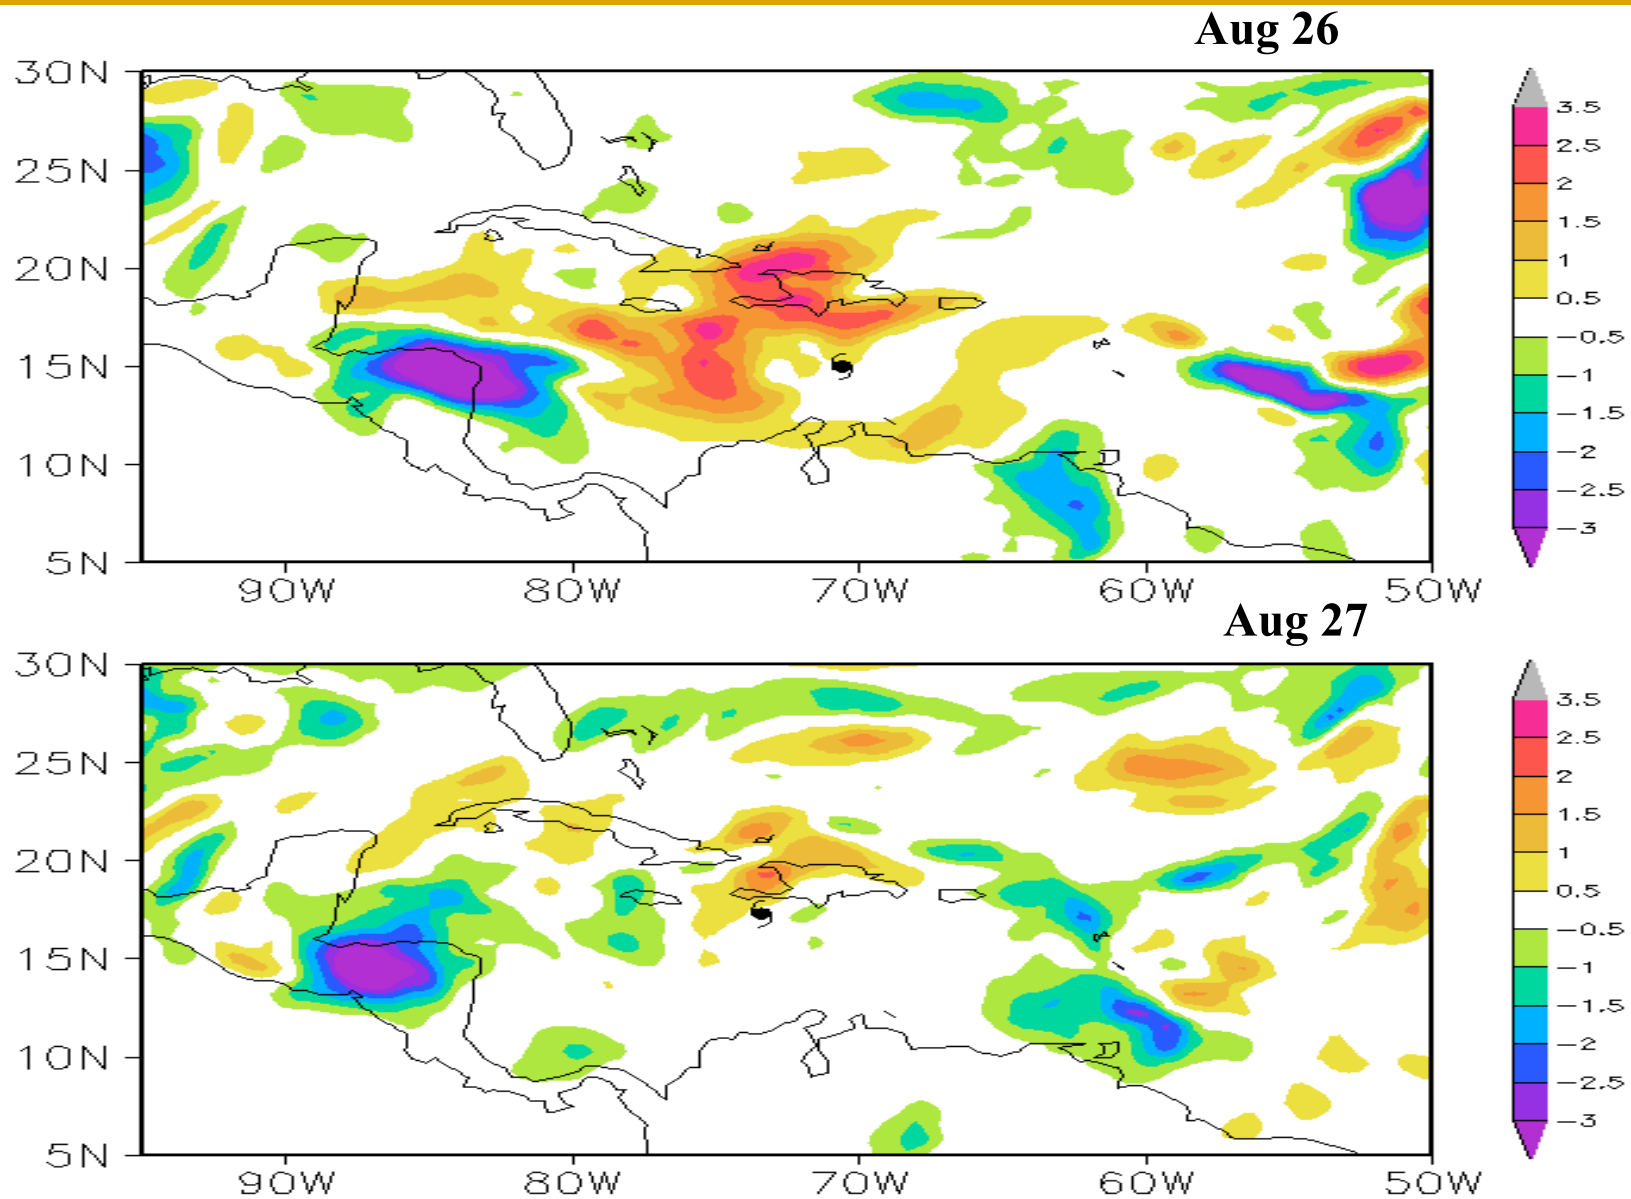

- Single field-of-view water vapor soundings (13.5 km at nadir) derived using CIMSS physical retrieval algorithm (Li et al. 2000)
- Clear sky only soundings are provided
- *AIRS-Q-only run*: Assimilation of only CIMSS Q soundings
- *NODA run*: Assimilation of no observations

AIRS WV data Coverage (August 26, 2006)

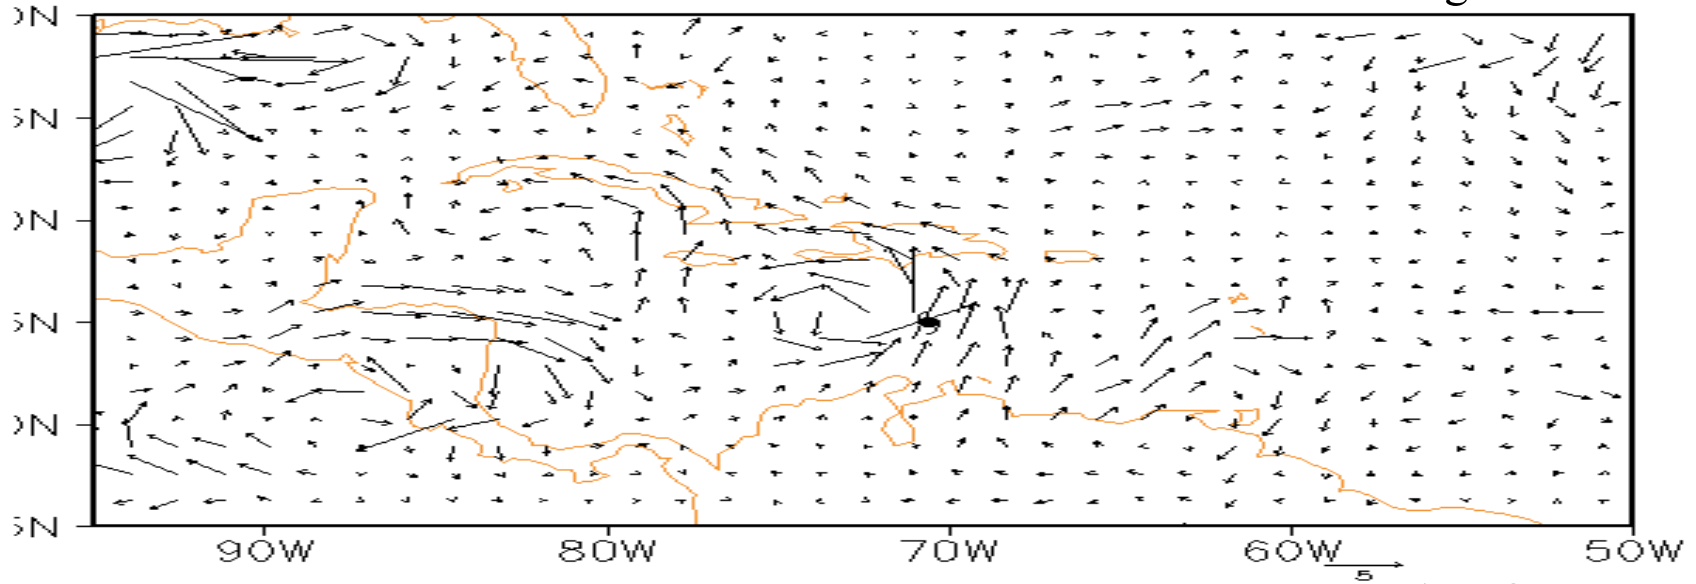

AIRS WV data coverage is much denser than GPS RO data in 2006

Daily water vapor increments (700mb, AIRS-Q-only run)

Daily wind analysis increments (700mb, AIRS-Q-only run)

Aug 26

Aug 27

2-hour Forecasts Fits to Radiosonde (22-28, August 2006)

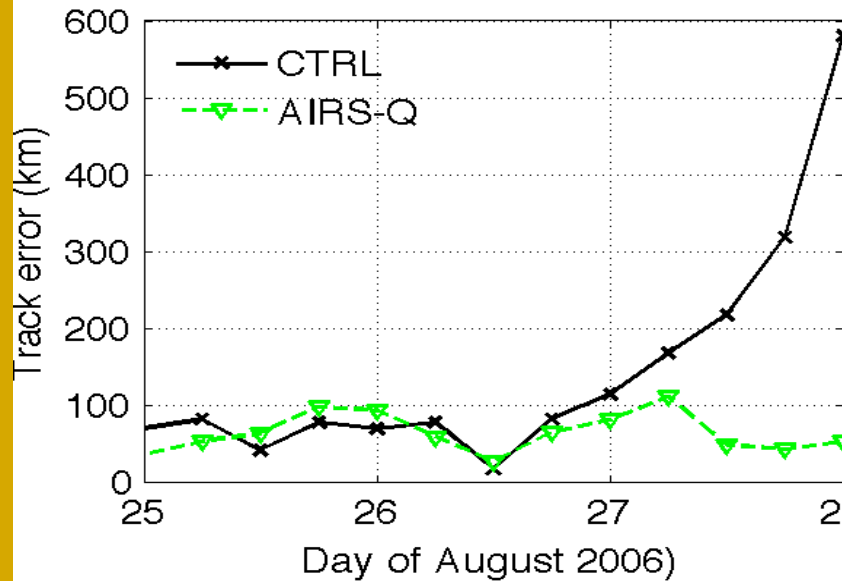

AIRS Assimilation Experiments (2)

- *CTL run*: Assimilate radiosonde, cloud winds, aircraft data, surface pressure data.
- *AIRS-Q run*: Same as CTL run plus CIMSS Q soundings.

Ensemble mean analyses on Hurricane Ernesto

Analyses of Ensemble Mean, 25-28, 00Z, August 2006)

Conclusion

- Satellite Q/T data in the environment of the TC can generate reasonable water vapor, temperature, and wind analysis corrections in TC environment and center through ensemble DA
- These data shows benefits in improving analyses of the hurricane track and intensity
