A Loosely Coupled Ocean-Atmosphere Ensemble Assimilation System.

Tim Hoar, Nancy Collins, Kevin Raeder, Jeffrey Anderson, NCAR Institute for Math Applied to Geophysics Data Assimilation Research Section

> Steve Yeager, Mariana Vertenstein, Gokhan Danabasoglu, Alicia Karspeck, and Joe Tribbia NCAR/NESL/CGD/Oceanography

Ocean Data Assimilation Motivation

The resulting high-fidelity ocean states are needed. The ensembles provide uncertainty quantification.

- Climate change over time scales of 1 to several decades has been identified as very important for mitigation and infrastructure planning.
- High fidelity ocean states will be needed by the IPCC decadal prediction program.
- The ocean plays a crucial role by providing a source or sink (and system memory) for the atmosphere of many quantities, such as heat, moisture, CO₂, etc.
- Increasing numbers of observations from larger regions of the oceans are making state-of-the-art data assimilation a promising possibility.

1. Use model to advance ensemble (3 members here) to time at which next observation becomes available.

Ensemble state estimate, $x(t_k)$, after using previous observation (analysis)

Ensemble state at time of next observation (prior)

tĸ

2. Get prior ensemble sample of observation, y = h(x), by applying forward operator **h** to each ensemble member.

Theory: observations from instruments with uncorrelated errors can be done sequentially.

3. Get observed value and observational error distribution from observing system.

AMS – 26 Jan 2011

pg 5

4. Compute the increments for the prior observation ensemble (this is a scalar problem for uncorrelated observation errors).

pg 6

5. Use ensemble samples of **y** and each state variable to linearly regress observation increments onto state variable increments.

6. When all ensemble members for each state variable are updated, there is a new analysis. Integrate to time of next observation ...

Experiment Overview

Compare the effect of using a single atmospheric boundary vs. an ensemble of atmospheric boundaries on ocean data assimilation with POP.

- **"23 POP 1 DATM**" denotes the experiment using 23 POP members and a single "data" atmosphere (CESM framework).
- **"48 POP 48 CAM**" denotes the loosely coupled experiment using 48 POP members and 48 consistent but unique CAM atmospheres.
- Both experiments were conducted for 1998 & 1999.
- The 48 POP 48 CAM experiment was subsequently chosen to produce initial conditions for the IPCC decadal prediction program.

Coupled Ocean-Atmosphere Schematic

- temperature observation error standard deviation == 0.5 K.
- salinity observation error standard deviation == 0.5 msu.

Experimental Configurations

23 POP 1 DATM

- 1. POP 1-degree displaced pole;
- 2. 23 ensemble members starting from a 'climatological' state;
- 3. Single 'data' atmosphere from CORE;
- 4. DART assimilates observations once per day in a +/- 12 hour window centered at midnight;
- 5. The CESM framework is responsible for all model advances.

The **48 POP 48 CAM** experiment differed in that:

- 1. 48 ensemble members starting from a 'climatological' state;
- 2. Atmospheric forcing from the DART/CAM ensemble reanalysis;

Guide to the following figures:

- 1. Ensemble mean 1-day lead forecast difference from observations.
- 2. **O** is # observations available; +,+ is # assimilated.
- 3. Obs are rejected if too far from ensemble mean (3 std dev here).

Ensemble *Spread* for 100m XBT (Expendable Bathythermograph)

- 1. Spread contracts too much for 23 POP 1 DATM;
- 2. Using single atmospheric forcing is also part of the problem;
- 3. Model bias adds to the problem;
- 4. DART Statistical Sampling Error Correction also helps.

Ensemble Spread for Pacific 100m XBT

Ensemble Spread for Atlantic 100m XBT

10m Mooring Temperature RMSE

- 1. Ensemble mean 1-day lead forecast difference from observations.
- 2. **O** is # observations available. +,+ is # assimilated.
- 3. Observations are rejected if they are too far from ensemble mean (3 standard deviations here).

10m Mooring Temperature RMSE – Pacific

Ensemble mean 1-day lead forecast difference from observations.

100m Mooring Temperature RMSE

- 1. 1/3 of the obs are still rejected by 48 POP 48 CAM in the Pacific.
- 2. Model bias in the thermocline?

100m Mooring Temperature RMSE – Pacific

The CAM-DART-POP Implementation

Uses the CESM1 software framework; ocean, atmosphere, and other components communicate through the coupler. A few minor script changes and use of the interactive ensemble capability permit each member of an ensemble of POPs to be forced by a different CAM atmosphere.

Once the additional files are staged, the basic implementation is a trivial addition to the run script that invokes the DART system.

```
# -----
# See if CSM finishes correctly (pirated from ccsm_postrun.csh)
# ------
# DART assimilation operating on restarts
# ------
```

```
grep 'SUCCESSFUL TERMINATION' $CplLogFile
if ( $status == 0 ) then
        ${CASEROOT}/assimilate.csh
endif
```
