

Orographic Precipitation II: Effects of Phase Change on Orographic Flow

Richard Rotunno

National Center for Atmospheric Research , USA

Condensation $\equiv -\frac{D\rho_{vs}}{Dt} \approx -w(x, z) \frac{\partial \rho_{vs}}{\partial z}$

$U \Rightarrow$
Large-Scale
Flow

z_0

H

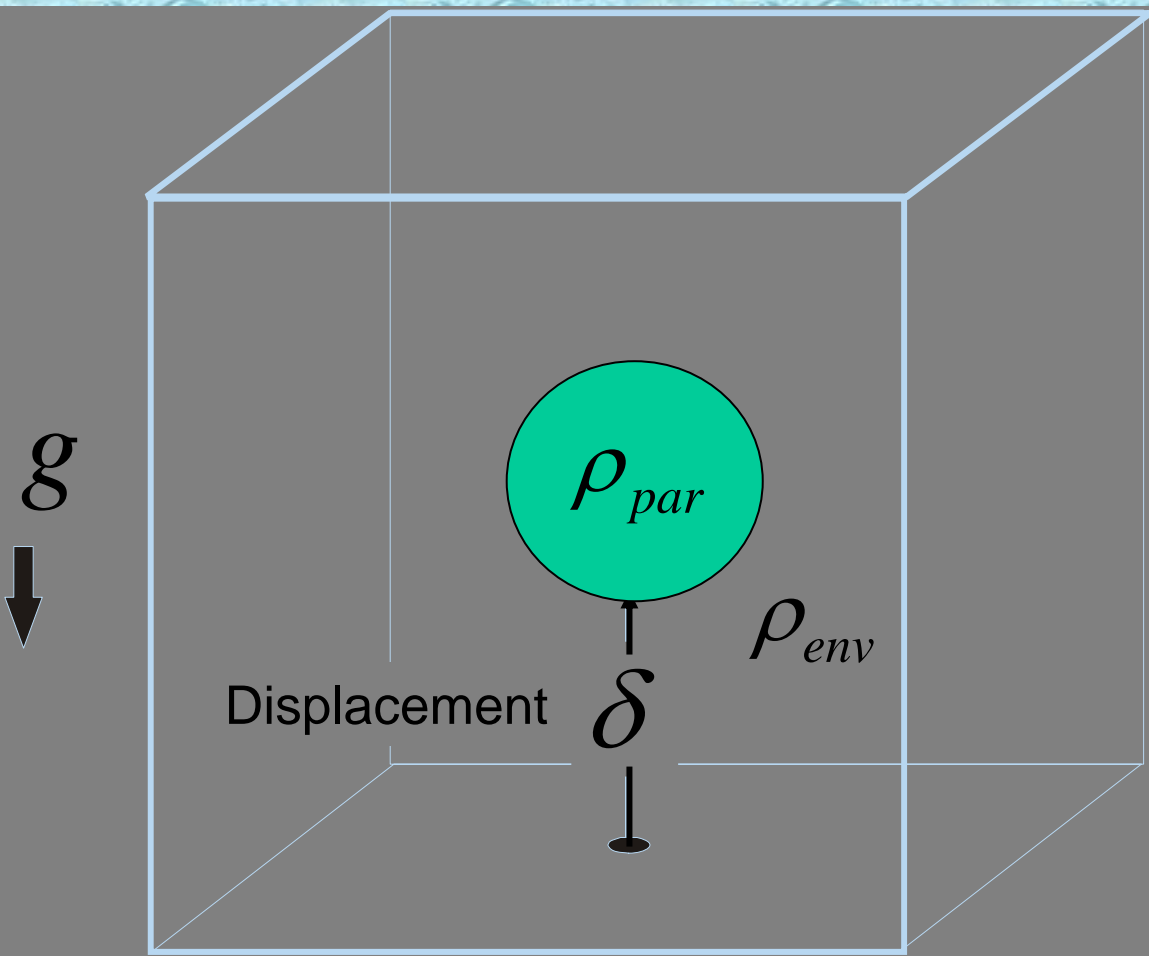

L

Dynamics \rightarrow

$$w = w(H, L, U, \text{Stability}, \text{Coriolis}, \text{3D Effects})$$

ρ_{vs} = saturation vapor density

Effects of Water in the Air on Buoyancy

$$B = g \frac{\rho_{env} - \rho_{par}}{\rho_{par}}$$

ρ = density
"env" = environment
"par" = parcel

moist air is a mixture

$$\rho = \rho_d + \rho_v + \rho_l$$

gas law

$$p = (\rho_d R_d + \rho_v R_v) T$$

/ definitions

$$\varepsilon \equiv \frac{R_d}{R_v} ; q_v \equiv \frac{\rho_v}{\rho_d} ; q_w \equiv \frac{\rho_v + \rho_l}{\rho_d}$$

gas law

$$p = \rho R_d \left(\frac{1 + q_v \varepsilon^{-1}}{1 + q_w} \right) T \equiv \rho R_d \tilde{T}$$

ρ = density
subscript d = dry air
subscript v = water vapor
subscript l = liquid water

substitute \check{T} for ρ

$$B = g \frac{\check{T}_{par} - \check{T}_{env}}{\check{T}_{env}}$$

$$\check{T} = \left(\frac{1 + q_v \varepsilon^{-1}}{1 + q_w} \right) T \cong (1 + 0.61q_v - q_l) T$$

water vapor less
dense than air

liquid water more
dense than air

Main Effect on Buoyancy through Phase Change

1st Law of Thermodynamics

$$c_p \frac{DT}{Dt} - \frac{1}{\rho} \frac{Dp}{Dt} = \frac{DQ}{Dt} = -L \frac{Dq_{vs}}{Dt}$$

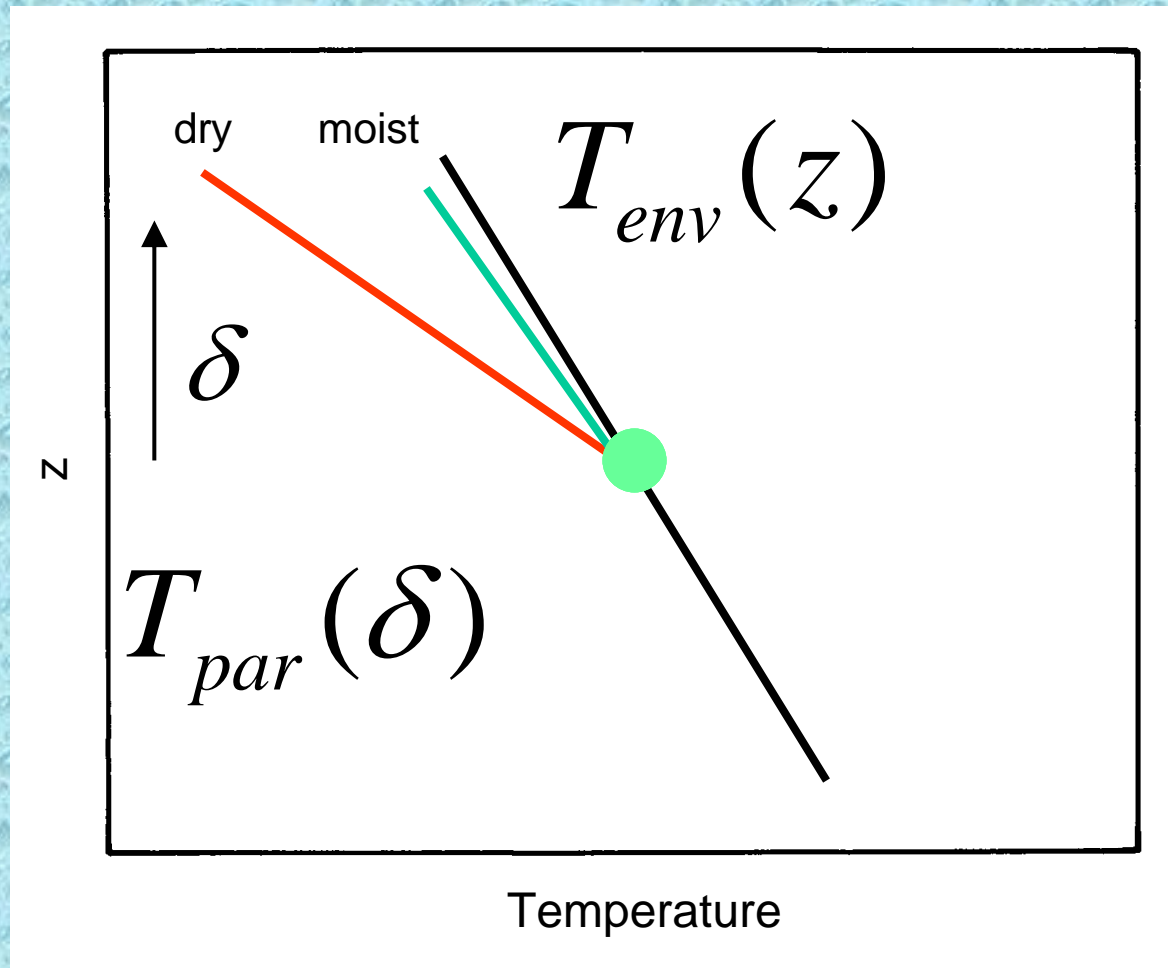

condensation \rightarrow
latent heat release

$$L \cong 600 \text{ cal g}^{-1}$$

$$c_p = .24 \text{ cal g}^{-1} \text{ } ^\circ\text{C}^{-1}$$

$$\Delta q_{vs} = -1 \text{ g Kg}^{-1} = -.001 \Rightarrow \Delta T \cong 2.5 \text{ } ^\circ\text{C}$$

Air Parcel Behavior with Phase Change

Latent Heat Release Reduces Stability

Dynamics: Stable Flow

Weak Stability, No Blocking

Simplest Model \rightarrow Rainout = Condensation

$$R(x) = \int_0^{\infty} -w(x, z) \frac{\partial \bar{\rho}_{vs}}{\partial z} dz$$

Simple Model Overestimates R

$$\frac{d\rho_{liq}}{dt} = \frac{d(\rho_c + \rho_r)}{dt} = -\frac{d\rho_{vs}}{dt} + \frac{\partial R}{\partial z}$$

Introduce Time Lags

$$\frac{d\rho_c}{dt} = -\frac{d\rho_{vs}}{dt} - \frac{\rho_c}{\tau_c}$$

Conversion from Cloud droplets to Raindrops

$$\frac{d\rho_r}{dt} = +\frac{\rho_c}{\tau_c} - \frac{\rho_r}{\tau_r}$$

Precipitation

Smith and Barstaad (2004)

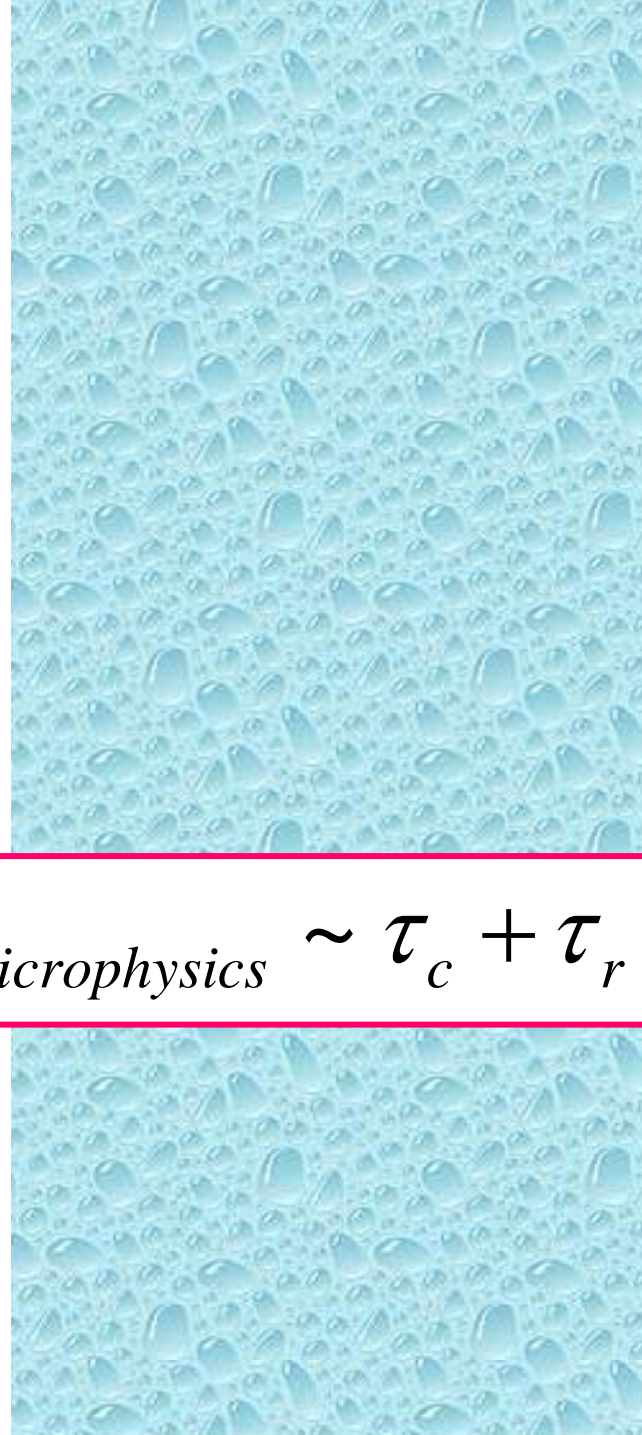

$$\tau_{microphysics} \ll \tau_{airflow}$$

$$1000s \ll \frac{L}{U}$$

$$U = 10m/s$$

L	L/U
100km	10000s
10km	1000s

$$\tau_{microphysics} \sim \tau_c + \tau_r$$

Transfer Function

Transform of precipitation field

Terrain transform

$$\hat{R}(k, l) = \frac{C_w i \sigma \hat{h}(k, l)}{[1 - im\lambda_\rho][1 + i\sigma\tau_c][1 + i\sigma\tau_r]}$$

Cold Air Outflow

Good News: Cool Air Outflows May Initiate New Cells Upstream →

Chu and Lin (2000)

Bad News: Cool Air Outflows May Propagate Too Far Upstream

Chu and Lin (2000)

Good News: Rain Accumulation Large if Wind Varies with Height such that Cells are Stationary wrt Mountain →

Big Thompson Flood Colorado, 1976

Caracena et al. (1979)

Caracena et al. (1979)

Summary

- Dynamics of orographic air flow strongly coupled to latent heating
- Stable Case: Latent heating renders flow less stable making possible flow over tall mountains condensing large amounts of water vapor. Microphysics present major uncertainties, however.
- Unstable Case: Convective cells may produce large amounts of condensed water, but motion of cells wrt to mountain makes detailed prediction difficult.
